SELECT NAMED DUTCH HYACINTHS

Don't be misled by low offers and cheap prices if you are looking for results

We buy only the very best goods in the following. Intending purchasers can rely upon all bulbs being thoroughly ripened, fully up to specified size and "quality" and true to name. We offer four sizes—Top-root, First, Second, Third or Named Bedding. These are Holland Standard sizes. We do not buy seconds and send out as first size, or third size and send out as second size, which device is usually practiced by firms who make ridiculously low prices. You can rely upon our "Quality" bulbs.

BODDINGTON'S "QUALITY"

Decoration Day, or May-Flowering TULIPS, Etc.

The difference between this class of Tulips and the Darwins is in some instances merely a botanical one, of little importance to the horticulturist, consisting of an inconspicuous yellow marking at the base of the petal inside the cup. Some varieties of Cottage Tulips are as large as the Darwins and have petals of obtuse shape. Many of them do not grow as tall as the Darwins, and a majority of the varieties have pointed petals which gives the flower a chalice shape, as will be seen in the accompanying illustration. They flower in May and June at the same time as the Darwins, and the majority of the varieties are equally as desirable.

HOUSE CULTURE OF BULBS IN FIBER

How to Grow Bulbs in Vases, Bowls, Jardinieres, etc., without drainage

A delightful and interesting method of cultivating bulbs is to grow them in our specially prepared Fiber in vases, bowls or jardinieres, without drainage. The advantage of this system is that the vases can be placed anywhere about the house without fear of damage from moisture, as drainage with this culture is unnecessary. Any receptacle can be used, provided it is non-porous and large enough to allow space for good root-growth. Our specially prepared Fiber is fertilized and mixed with pulverized charcoal and crushed oyster shells. This combination furnishes all the plant-food elements required by bulbs, and only needs to be moistened with water before use. Almost any of the Spring-flowering bulbs may be grown in our prepared Fiber, but we consider the following species best suited for this purpose: Roman and Dutch Hyacinths, Narcissi, Jonquils, Early Tulips, Crocuses, Scillas, Freesias, Snowdrops, also Lily of the Valley Pips, Spiraeas, etc. It is better not to mix different varieties of bulbs in one bowl unless simultaneous flowering can be assured.

CULTURAL DIRECTIONS

When growing bulbs in vases without drainage it is first necessary to water the Fiber, then rub it through the hands until it is free from lumps. If the mixing is properly done the Fiber will increase in bulk, and if taken in the hand and squeezed, little or no water should drop out. When potting, put the large pieces of charcoal (which we send with the Fiber) in the bottom of the vase to absorb the impurities and keep the mixture sweet, then put in 1 to 3 inches of the Fiber, according to the depth of the bowl. After placing the bulbs in position so that their tips reach to within half an inch of the rim, the spaces between and around the bulbs should be filled with the moistened Fiber. It is not necessary or desirable to press it tightly, as the roots do not grow freely if it is pressed too firmly. Small bulbs such as Scillas, Crocuses, Snowdrops, Jonquils, etc., should be planted fairly close together in order to produce the best effect. After planting, the bowls should be kept in a cool, airy cellar or room (not a confined closet) for about eight or ten weeks, so that they may develop good root-growth, which is very essential in order to get good results. The bowls should be examined once a week, and a little water given when necessary, as the Fiber must not be allowed to get dry or the flower buds become "blind." The surface should always look moist, but if too much water has been given the bowl may be held carefully on its side so that the surplus water can drain away. As the growth increases more water will be required and as much light as possible to insure sturdy foliage. A succession of bloom may be had during the Winter by taking into the house a few dishes at intervals of about two weeks.

WINTER-FLOWERING SWEET PEAS

Cultivation.—White-seeded varieties must be sown in sand in small pots, not in earth, or they will rot or "damp off"; later, transplant to the permanent position. Winter-flowering Sweet Peas should not be sown too thickly, about one ounce to 100 feet is sufficient. Thin out to about 3 inches apart when plants are about 6 inches high; if wanted for Christmas, sow before the end of August; if wanted during January, February and March, about the middle of September; if wanted for Easter, about the first of November. For successful growing, a temperature of 40 to 45 degrees at night and 10 degrees higher in the day is considered best. Watch out for red spider, thrips and green fly. Feed when plants are in full bloom.
